

TODO — deploy fix for vormamim.com

What's broken

`data/` and `assets/` never made it onto the live host, even though the code did. Confirmed by checking these directly — all four return 404:

- <https://www.vormamim.com/blockbusters/data/sample-year7-computing.csv>
- <https://www.vormamim.com/blockbusters/data/sample-year11-se.csv>
- https://www.vormamim.com/blockbusters/assets/blockbusters_landing.png
- <https://www.vormamim.com/blockbusters/assets/tvshow.png>

Meanwhile `app.js` and `style.css` on the live site are already the current versions (checked — `app.js` has the full `SAMPLE_DECKS` list including Year 7 Computing). So this isn't a stale deploy, it's specifically the two subfolders missing. The zip itself is fine (verified locally, both PNGs and all 6 CSVs present at full size) — most likely cause is files were uploaded individually rather than by extracting the zip in place, which usually can't carry subfolder structure.

What to do

1. `dist/` and `blockbusters.zip` are gitignored (build output, not committed), so on a fresh PC run first:

```
npm run build
Compress-Archive -Path dist\* -DestinationPath blockbusters.zip -Force
```

2. On vormamim.com's file manager, go to the `/blockbusters/` folder.
3. Upload `blockbusters.zip` there and use the host's "Extract" action on it (recreates `data/` and `assets/` automatically) — **or**, if there's no extract feature, manually create `data/` and `assets/` subfolders and upload every file from local `dist/data/` and `dist/assets/` into them.
4. Verify by re-checking the four URLs above — they should return the actual file content, not a 404.

See `README.md`'s "Deploying" section for the full build/zip commands.
